#### 66115 / 2014 / Frühjahr

# Thema 2 / Aufgabe 5

(Klasse "Stapel" mit Methode "merge()")

Stichwörter: Stapel (Stack), Algorithmische Komplexität (O-Notation)

Gegeben sei eine Standarddatenstruktur Stapel (Stack) mit den Operationen

```
- void push(Element e)
- Element pop(),
- boolean isEmpty().
```

sowie dem Standardkonstruktor Stapel(), der einen leeren Stapel zur Verfügung stellt.

(a) Geben Sie eine Methode Stapel merge(Stapel s, Stapel t) an, die einen aufsteigend geordneten Stapel zurückgibt, unter der Bedingung, dass die beiden übergebenen Stapel aufsteigend sortiert sind, d.h. S.pop() liefert das größte Element in s zurück und T.pop() liefert das größte Element in t zurück. Als Hilfsdatenstruktur dürfen Sie nur Stapel verwenden, keine Felder oder Listen.

Hinweis: Nehmen Sie an, dass Objekte der Klasse Element, die auf dem Stapel liegen mit compareTo() vergleichen werden können. Zum Testen haben wir Ihnen eine Klasse StapelTest zur Verfügung gestellt, sie können Ihre Methode hier einfügen und testen, ob die Stapel korrekt sortiert werden. Überlegen Sie auch, was geschieht, wenn einer der Stapel (oder beide) leer ist!

Lösungsvorschlag

```
public static Stapel merge(Stapel s, Stapel t) {
  // Die beiden Stapel unsortiert aneinander hängen.
  Stapel mergedStack = new Stapel();
  while (!s.isEmpty()) {
    mergedStack.push(s.pop());
  while (!t.isEmpty()) {
    mergedStack.push(t.pop());
  // https://www.geeksforgeeks.org/sort-stack-using-temporary-stack/
  Stapel tmpStack = new Stapel();
  while (!mergedStack.isEmpty()) {
    Element tmpElement = mergedStack.pop();
    while (!tmpStack.isEmpty() && tmpStack.top.getValue() >
    → tmpElement.getValue()) {
      mergedStack.push(tmpStack.pop());
    tmpStack.push(tmpElement);
  return tmpStack;
                Code-Beispiel auf Github ansehen: src/main/java/org/bschlangaul/examen/examen_66115/jahr_2014/herbst/Stapel.java
```
